

Global Tech and Innovation TAMIM Fund

At 31 December 2024

Dear Investor,

We provide this monthly report to you following the conclusion of the month of December 2024.

For the month of December, the Global Technology & Innovation fund was up just over 0.68%. For context, the Nasdaq was up 0.48% and the Semiconductor Index (SOXX) was ~flat, while the equal weight S&P (RSP) was **down almost 7%** – highlighting a lot of weakness under the surface.

After ramping up exposure just ahead of the election, we began to pare that back in mid-December as a lot of our focus areas were extended – moving too far, too fast. We plan to re-deploy this cash on likely volatility in January and February. As we transition to the new administration in the US, we expect some turbulence as they hit the ground running with their policies and a clear mandate – and we would like to see what they choose to prioritise prior to fully scaling back up. Overall, we expect a lot of volatility in the market in 2025 – which should present many opportunities for active managers. And **we've built this strategy to capitalise on the confluence of these massive, once-in-a-generation shifts** – which we have been studying and preparing for for years – that are **set to accelerate in 2025/2026**.

As noted in our November update, the election outcome provides both clarity to our focus areas as well as accelerants to our thematic views – see our [video](#) highlighting our detailed takes on the election results. With this increased policy clarity and clear mandate from the US public, we are now more confident in honing in on the best areas to invest. Most notably, we remain focused on investing in Artificial Intelligence (AI) – which is a critical area for both deterrence and productivity – as well as US onshoring and reindustrialisation – which Trump plans to indirectly incentivise via tariffs. What is quite clear is the **focus on investing in productivity and efficiency** (i.e., Technology-first agenda, spearheaded by Elon Musk) and hitting the ground running – which we can clearly see as Trump has already engaged in trade negotiations and posturing even prior to taking office. In the background, liquidity injections are moderating – China is seemingly awaiting further action until there is clarity on Trump's plans, which has driven the Chinese 10y yield to new lows. And in the US, the Federal Reserve has paused, which is a partial driver of US 10y yields to new local highs – bring the USD up with it. We believe all of these policy actions are inter-linked and are being used for geopolitical negotiations – which fits with our broader holistic framework laid out in our fund docs. In the month ahead,

Portfolio Performance

Monthly Return Stream

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sept	Oct	Nov	Dec	YTD

Global Tech and Innovation TAMIM Fund

At 31 December 2024

we will publish some updated predictions on what we expect over the coming two years – **which we expect will be the most compressed change in human history.**

- **Technology** -- most notably, AI -- AI is a **foundational** layer that will permeate all of society. We continue to believe this Technological cycle will **dwarf** the Internet, Mobile, and other preceding technological revolutions -- and we are already beginning to see hints of this with **step-function advancements** in robotics, self-driving vehicles, and the automation of many white-collar tasks. With Elon Musk involved and Trump focused on general de-regulation, we expect areas like **autonomy will accelerate in the coming years** – in fact, we are already seeing it as the [Trump team seeks to ease US rules for self-driving cars](#). Federal clarity around this would be a game-changer for the industry, as the technology is already there – we are primarily awaiting regulation and legal guidelines to accelerate implementation. While phase 1a of the AI buildout has been primarily focused on Compute infrastructure, we are beginning to shift into phase 1b -- with a focus on Networking and Memory, **two major bottlenecks that can unlock significant gains**, notably on the inference side. The next emerging phase will likely be on the power generation front – and we are actively evaluating adding positions for this wave (see Energy pillar below). These developments seem to be accelerating, with new winners and losers at each juncture.
- **Energy**, another major pillar of power, is a critical input into any system -- the base layer for both Technology and Money. In order to power the AI data center demand + reshoring in the US + electric vehicle proliferation, we need to both increase reliable base load power (i.e., [nuclear and natural gas](#)) and upgrade the grid. We are beginning to see signs of this cycle emerging in the US: [Amazon](#) buys nuclear powered data center to accelerate AI, [Microsoft](#) partnering to re-open the 'infamous' 3-mile island nuclear power plant to power its AI data center, [Google](#) to buy power from small modular reactor company, [Palisades](#) Michigan nuclear power plant potentially reopening supported by the Department of Energy. And under the Trump administration we expect ensuring cheap, reliable energy will be a key focus – as they fully understand that without reliable, inexpensive energy, you cannot have industry. His selection for the Department of Energy – [Chris Wright](#) – is an excellent sign; we finally **expect US innovation and creativity to infiltrate the energy space, creating huge opportunities for our sub-universe.**
- **Money** - the final pillar of power - is critical but often overlooked, as it helps store energy and finance Technological progress. The US is in a uniquely powerful position with the US dollar as the global reserve currency -- which is the foundation of the current interconnected global system. And to better leverage the system, the US is contemplating launching its own [Sovereign Wealth Fund](#) -- which would potentially be a massive boon for Tech and Energy investment and progress. This is the base premise of our Fund and our three pillars of power – **the West needs to accelerate investment (Money) in critical areas (notably key Technology and Energy) to maintain and/or expand its Power, which is being directly challenged by China.** From the Biden Administrations National Security Strategy Report dated Oct 2022:

*"We must complement the innovative power of the private sector with a modern industrial strategy that makes strategic public investments in America's workforce, and in strategic sectors and supply chains, especially critical and emerging technologies, such as **microelectronics, advanced computing, biotechnologies, clean energy technologies, and advanced telecommunications.**"*

Overall, the above are positive signposts for our thesis and should provide further tailwinds for our themes and universe – and we believe the Trump administration will likely accelerate essentially all of these themes (notably, US reshoring and AI) as they are deeply focused on the Pillars of Power we've created. Check out our [latest webcast](#) for a refresher on the global backdrop, the Pillars of Power, and the path ahead. We are incredibly **excited about the opportunity set that lies ahead given where we are within this technological innovation wave, and what must happen on the global landscape front.**

Portfolio Highlights:

Tesla (TSLA) is a pioneering electric vehicle, clean energy, and automation company that has revolutionised the automotive industry through its innovative approach to manufacturing and holistic vision of the electrification, automation, and robotics spheres. The company designs, develops, manufactures, and sells high-performance electric vehicles, solar panels, energy storage systems, and robotics. In the electrification supply chain, Tesla has vertically integrated many aspects of production, including battery cell manufacturing, to reduce costs and ensure supply (a similar approach as Apple in smartphones). For automation and robotics, Tesla heavily utilises advanced manufacturing techniques in its factories, employing sophisticated robots for tasks across the end-to-end process. The company's commitment to automation extends beyond manufacturing to its vehicles, with Tesla a leader in developing autonomous driving technology (with a vision-first approach). Tesla now has over 5 millions vehicles on the road. These vehicles are essentially robots on wheels, gathering data. And, when they are ready, they can basically flip a switch and overnight these cars can become partial or full self-driving. Additionally, Tesla is expanding into humanoid robotics with its Optimus project, further solidifying its position in the robotics supply chain. Through these initiatives, Tesla has positioned itself as a central player in the intersection of electrification, automation, and robotics, driving innovation across multiple industries.

At 31 December 2024

Only [BYD](#) in the East, and Tesla in the West have cost structures that we believe will be competitive in this "new world" order. As we've laid out historically, we continue to think the majority of the other electric OEMs in the space will likely head toward zero -- similar to what happened with internal combustion engine OEMs in the early 20th century. The legacy auto OEMs will also end up being displaced over time as well -- as electric technology is simply superior to internal combustion and continues to improve. We are already seeing this with Ford recognising how [far behind they are](#), and VW is [shutting German factories](#) due to under-utilisation. Further, both Tesla and BYD continue to separate themselves from the pack by now beginning to really lean into the software/AI side of their respective businesses -- which will ultimately power their autonomous driving continue to separate themselves from the pack by now beginning to really lean into the software/AI side of their respective businesses -- which will ultimately power their autonomous driving experiences and the surrounding ecosystem. The recent progress on the self-driving front has been notable -- across both Tesla vehicles (see step functions improvements in chart below), as well as what's coming on the humanoid robot front (Elon's [latest robot views](#)) which is a massive multi-trillion dollar opportunity (second chart below estimates). Overall, we believe Elon Musk will help guide the Trump administration to help accelerate automation in the US -- given it is both a National Security concern (i.e., China pushing ahead by allowing for autonomous vehicles on the streets) and a potential huge boon for productivity (i.e., imagine all the extra time you'd have if you weren't driving stuck in traffic). This position has been reduced, but we remain optimistic on the massive opportunity set ahead and are actively monitoring for re-entry.

Kinaxis Inc. (TSX: KXS) is a leading provider of cloud-based supply chain management solutions, offering its flagship RapidResponse platform as a software-as-a-service (SaaS) product. Kinaxis's solutions address various aspects of supply chain management, including demand planning, inventory management, and sales and operations planning. In the context of automation and reshoring, Kinaxis plays a crucial role by providing AI and machine learning-powered capabilities that enable companies to optimise their supply chains, reduce lead times, and improve responsiveness to market changes. Their tools support the trend towards reshoring by helping businesses manage complex, localised supply networks more efficiently. By offering end-to-end supply chain visibility and powerful simulation capabilities, Kinaxis empowers companies to make faster, more informed decisions, which is particularly valuable in today's volatile business environment where agility and resilience are paramount.

Kinaxis is a new position in the portfolio and a company that we believe will be a key enabler in the accelerated reshoring agenda of the Trump administration. Simplistically, Kinaxis will help both accelerate the reshoring process and help companies optimise their "new" supply chains in the multi-polar world we are entering.

Broadcom Inc. (AVGO) is a global technology company that designs, develops, and supplies a wide range of semiconductor and infrastructure software solutions. The company operates in two main segments: Semiconductor Solutions and Infrastructure Software. Broadcom provides essential components and technologies to help enable the electrification, automation and robotics supply chain. Their semiconductor products, including system-on-chips (SoCs), wireless communication chips, and custom silicon solutions, are used in various applications such as data center networking, broadband access, telecommunication equipment, smartphones, and factory automation systems. Broadcom's offerings in RF front-end modules, Wi-Fi, Bluetooth, and GPS technologies contribute to the advancement of connected and automated systems. Additionally, their focus on Ethernet switching, routing solutions, and fiber optic components supports the infrastructure needed for robotics and automation in industrial

Global Tech and Innovation TAMIM Fund

At 31 December 2024

settings. By providing these critical technologies, Broadcom enables the development and implementation of smart, connected devices and systems that are fundamental to the ongoing trends in electrification, automation, and robotics across multiple industries.

As noted, Broadcom is a key semiconductor supplier into several key thematic areas we are focused on -- many of which they have a monopoly or oligopoly in, such as Ethernet switching. Most notably, AVGO is a key beneficiary as we move through phase 1b of the AI buildout – as they help remove bottlenecks on the Networking side of the equation, enabling a more holistic use of the Compute bandwidth. In addition, they provide ASIC design – similar to MRVL – for many of the hyperscalers who are seeking to build out their own data center chips. Overall, they are a key ‘blue jeans to gold miners’ player in the complete re-architecture of data centers for the AI age that has just begun. We removed this position in December, but are monitoring for re-entry.

Global Tech and Innovation TAMIM Fund

The Three Pillars

These are our three Pillars of Power and the core focus areas of the Global Technology & Innovation Fund. The pillars are synergistic, self-reinforcing, and collectively construct the foundations of geostrategic Power.

The goal is to capitalise on the growth and transformation of these pillars of Power – Technology, Energy, and Money – and the ultimate end state system that is built. Just as there were several building blocks that enabled the mobile Internet and related app ecosystem – from cables, to computers, to cloud infrastructure, to smartphones, and then to software – we expect a similar process for these pillars, with opportunities along the path.

- advanced computing
- artificial intelligence (“AI”)
- automation & robotics
- enabling hardware and software,
- sensor technology
- cybersecurity
- logistics-related technology
- electrical systems
- communication infrastructure
- communication platforms
- space & satellite technology
- energy creation & battery storage
- basic materials
- monetary debasement hedges

Why Now?

The Age of AI has Begun

Semiconductors are the foundational enabling Technology. Artificial Intelligence is the next Revolution

Its EARLY

"Over time, AI will be the biggest technological shift we see in our lifetimes. It's bigger than the shift from desktop computing to mobile, and it may be bigger than the internet itself. It's a fundamental rewiring of technology and an incredible accelerant of human ingenuity," Sundar Pichai (CEO of Google)

Its BIG

"The development of AI is as fundamental as the creation of the microprocessor, the personal computer, the Internet, and the mobile phone. It will change the way people work, learn, travel, get health care, and communicate with each other," Bill Gates (Founder of Microsoft)

Its GROWING

Technological progress is cumulative – current technologies build upon prior technologies and their networks. The result is explosive exponential growth – it took ChatGPT 5 days to reach 1 million users; it took Netflix 3.5 years.
